\triangleright Define new method for generic function *foo*. *spec-vars* specialize to either being of *class* or being **eql** *bar*, respectively. On invocation, *vars* and *spec-vars* of the new method act like parameters of a function with body *form*^{*}. *forms* are enclosed in an implicit ^{so}**block** *foo*. Applicable *qualifiers* depend on the **method-combination** type; see section 10.3.

10.3 Method Combination Types

standard

▷ Evaluate most specific **:around** method supplying the values of the generic function. From within this method, **call-next-method** can call less specific **:around** methods if there are any. If not, or if there are no **:around** methods at all, call all **:before** methods, most specific first, and the most specific primary method which supplies the values of the calling **call-next-method** if any, or of the generic function; and which can call less specific primary methods via **call-next-method**. After its return, call all **:after** methods, least specific first.

and|**or**|**append**|**list**|**nconc**|**progn**|**max**|**min**|**+**

▷ Simple built-in **method-combination** types; have the same usage as the *c-types* defined by the short form of **define-method-combination**.

(^M**define-method-combination** *c-type*
 $\left\{ \begin{array}{l} \text{:documentation } \widehat{string} \\ \text{:identity-with-one-argument } \text{bool}_{\text{NIL}} \\ \text{:operator } \text{operator}_{\text{c-type}} \end{array} \right\}$)

▷ **Short Form.** Define new **method-combination** *c-type*. In a generic function using *c-type*, evaluate most specific **:around** method supplying the values of the generic function. From within this method, **call-next-method** can call less specific **:around** methods if there are any. If not, or if there are no **:around** methods at all, return from the calling **call-next-method** or from the generic function, respectively, the values of (*operator* (*primary-method* *gen-arg**)*), *gen-arg** being the arguments of the generic function. The *primary-methods* are ordered $\left[\begin{array}{l} \text{:most-specific-first} \\ \text{:most-specific-last} \end{array} \right] \text{[:most-specific-first]}$ (specified as *c-arg* in **defgeneric**). Using *c-type* as the *qualifier* in **defmethod** makes the method primary.

(^M**define-method-combination** *c-type* (*ord-λ**) ((*group*
 $\left\{ \begin{array}{l} * \\ (\text{qualifier}^* \text{ [*]}) \\ \text{predicate} \end{array} \right\}$
 $\left\{ \begin{array}{l} \text{:description } \text{control} \\ \text{:order } \left\{ \begin{array}{l} \text{:most-specific-first} \\ \text{:most-specific-last} \end{array} \right\} \text{[:most-specific-first]} \\ \text{:required } \text{bool} \end{array} \right\}$)*
 $\left\{ \begin{array}{l} (\text{:arguments } \text{method-combination-}\lambda^*) \\ (\text{:generic-function } \text{symbol}) \\ (\text{declare } \widehat{decl}^*)^* \\ \widehat{doc} \end{array} \right\}$ *body*^P*)

▷ **Long Form.** Define new **method-combination** *c-type*. A call to a generic function using *c-type* will be equivalent to a call to the forms returned by *body** with *ord-λ** bound to *c-arg** (cf. ^M**defgeneric**), with *symbol* bound to the generic function, with *method-combination-λ** bound to the arguments of the generic function, and with *groups* bound to lists of methods. An applicable method becomes a member of the leftmost *group* whose *predicate* or *qualifiers* match. Methods can be called via ^M**call-method**. Lambda lists (*ord-λ**) and (*method-combination-λ**) according to *ord-λ* on p. 17, the latter enhanced by an optional **&whole** argument.

$$(\text{call-method } \left\{ \begin{array}{c} \widehat{\text{method}} \\ \text{make-method } \widehat{\text{form}} \end{array} \right\} [(\left\{ \begin{array}{c} \widehat{\text{next-method}} \\ \text{make-method } \widehat{\text{form}} \end{array} \right\})^*])$$

▷ From within an effective method form, call *method* with the arguments of the generic function and with information about its *next-methods*; return its values.

11 Conditions and Errors

For standardized condition types cf. Figure 2 on page 31.

$$(\text{define-condition } \text{foo} \text{ (parent-type}^* \text{condition)})$$

$$\left(\left(\text{slot} \left\{ \begin{array}{l} \text{:reader } \text{reader}^* \\ \text{:writer } \left\{ \text{writer} \right\}^* \\ \text{:accessor } \text{accessor}^* \\ \text{:allocation } \left\{ \begin{array}{l} \text{:instance} \\ \text{:class } \text{instance} \end{array} \right\} \\ \text{:initarg } \text{initarg-name}^* \\ \text{:initform } \text{form} \\ \text{:type } \text{type} \\ \text{:documentation } \text{slot-doc} \end{array} \right\} \right) \right)^* \right)$$

$$\left(\begin{array}{l} \text{:default-initargs } \{ \text{name value} \}^* \\ \text{:documentation } \text{condition-doc} \\ \text{:report } \left\{ \begin{array}{l} \text{string} \\ \text{report-function} \end{array} \right\} \end{array} \right)$$

▷ Define, as a subtype of *parent-types*, condition type *foo*. In a new condition, a *slot*'s value defaults to *form* unless set via *:initarg-name*; it is readable via (*reader i*) or (*accessor i*), and writable via (*writer i value*) or (**setf** (*accessor i*) *value*). With **:allocation** **:class**, *slot* is shared by all conditions of type *foo*. A condition is reported by *string* or by *report-function* of arguments condition and stream.

$$(\text{make-condition } \text{type } \{ \text{:initarg-name value} \}^*)$$

▷ Return new condition of *type*.

$$\left(\begin{array}{c} \text{signal} \\ \text{warn} \\ \text{error} \end{array} \right) \left\{ \begin{array}{l} \text{condition} \\ \text{type } \{ \text{:initarg-name value} \}^* \\ \text{control } \text{arg}^* \end{array} \right\}$$

▷ Unless handled, signal as **condition**, **warning** or **error**, respectively, *condition* or a new condition of *type* or, with ^{Fu}**format** *control* and *args* (see p. 37), **simple-condition**, **simple-warning**, or **simple-error**, respectively. ▷ Unless handled, signal as correctable **error** *condition* or a new condition of *type* or, with ^{Fu}**format** *control* and *args* (see p. 37), **simple-error**. In the debugger, use ^{Fu}**format** arguments *continue-control* and *continue-args* to tag the continue option. Return NIL.

▷ Return values of forms or, in case of **errors**, NIL and the condition.

▷ Transfer control to innermost applicable restart with same name (i.e. **abort**, ..., **continue** ...) out of those either associated with *condition* or un-associated at all; or, without *condition*, out of all restarts. If no restart is found, signal **control-error** for **abort** and **muffle-warning**, or return NIL for the rest.
